

CANNADOR®

PREMIUM STORAGE FOR THE CONNOISSEUR

Thank you for purchasing one of our beautifully crafted products. A lot of time and thought goes into the design and production of a Cannador® product and we're certain you will appreciate our quality. Your satisfaction is very important to us.

The Cannador® was created to keep your top shelf collection fresh and in style. We wanted to make something that was both functional and aesthetically pleasing.

The idea spawned from a visit to a friend's place for an evening of fun, and when the time came to partake in the evening's festivities, a shoebox was pulled out and laid on the coffee table. The box was full of loosely strewn bottles and paraphernalia and it looked rather juvenile. The quest to make something better became our mission, and that mission continues today.

USING YOUR CANNADOR® WITH HUMIDITY PACKS

01

PLACE.

Place one Boveda® pack in each airtight jar.

02

REPLACE.

Once the Boveda® pack begins to harden, it is time to replace.

- * No seasoning is required if you are using Boveda® packs with airtight lids.
- * Humidity packs are sold separately

CANNADOR®

PREMIUM STORAGE FOR THE CONNOISSEUR

UPGRADE YOUR CANNADOR® STORAGE BOX TO A HUMIDOR WITH OUR HUMIDOR UPGRADE KIT

The Cannador® is versatile in that it can be used as a storage box with airtight lids or a humidor with ventilated lids. We have simplified the humidor process and packaged a Humidor Upgrade Kit for every Cannador® model that includes the following:

- » VaporBeads are a renewable humidity control product that maintains the appropriate relative humidity (RH) in your humidor (between 55% to 65% RH)
- » Ventilated adjustable lids that allow humid air to enter the glass cups and prevent cross-over from multiple strains being stored in the Cannador®

What we like about VaporBeads is its sustainability because it can be re-saturated with water to maintain the appropriate RH. Products like humidity packs will eventually dry out and need to be replaced whereas VaporBeads can last up to 3 years before it begins showing signs of losing its ability to maintain humidity.

Enjoy the ability to revive dried flower or maintain sticky buds by upgrading your Cannador® with our **Humidity Upgrade Kit** only at mycannador.ca

* Humidor Upgrade Kit is sold separately

PREMIUM STORAGE FOR THE CONNOISSEUR

USING YOUR CANNADOR® WITH VAPORBEADS

01

SEASON.

Fill an empty glass jar with water and let it sit in your Cannador®. Close the lid of the Cannador® and let the Cannador® sit idle for 1 week. This allows the moisture to more slowly evaporate into the wood.

02

HYDRATE.

Saturate half of the VaporBeads in distilled or reverse-osmosis water. Then place the VaporBeads into the Cannador® where the metal piece is affixed to the lid. Continue to leave the glass jar that's filled with water inside of the Cannador® for another week along with the saturated VaporBeads.

03

BEGIN USING.

After 2 weeks of seasoning (3 if you live in an arid environment), you can now remove the glass of water and re-saturate half of your bead case, then proceed with using your Cannador® as a humidor. Once the beads turn white, it's time to re-saturate them with water. You do not need to repeat the seasoning process again if you continually re-saturate the VaporBeads on a consistent basis, however, you should re-season your Cannador® if you have not used it as a humidor for a long time and wish to use it as a humidor again.

DO'S AND DON'TS

- » **Do:** Only dip half of bead system in distilled, bottled or reverse osmosis (RO) water.
- » **Do:** Wait until beads turn white in between re-hydrating.
- » **Do:** Season your Cannador® when you first use it. If you do not use your Cannador® for a prolonged period, you should re-season it when you begin using it again.

- » **Do Not:** fully submerge bead case in water. This is too much moisture.
- » **Do Not:** Always keep beads wet. They don't need that much moisture to be functional.
- » **Do Not:** Leave your humidor where there is high exposure to heat or sunlight. Heat increases RH levels.

FAQ

» Do I need to keep the vents all the way open?

It does not matter whether the vents are fully open or closed within the Cannador® because they are not fully airtight. When you remove the glasses from the Cannador®, you may wish to keep the vents closed in order to minimize RH loss.

» I see black dots in the bead case. Is this mold?

Yes, this only happens when the beads are over-saturated with water. They do not need much moisture to maintain the appropriate RH levels. You will need to replace the beads if there is mold.

» I've mistakenly over saturated my bead case, what do I do?

Let the bead case sit outside of the Cannador® for several days before placing back inside. This will allow it to wick off excess moisture.

» What is the optimal RH?

55% to 62% RH is best, but if the RH goes a few percentage points above or below this zone, that is okay too.

» My rewritable strain labels get smudgy after a while, do I need new ones?

Similar to a dry-erase white board, you can use isopropyl alcohol and this will take off any residue from your dry-erase marker, making it good as new!
